

ZADDP

Zombie API Discovery & Defence Platform

What is ZADDP?

ZADDP is a security command center for discovering, classifying, securing, and decommissioning zombie and shadow APIs in your organisation. It provides a unified dashboard for API security teams to gain visibility into their entire API inventory, identify undocumented and unmanaged APIs, assess security risks, and automate the decommissioning lifecycle of zombie APIs.

Key Features

- **API Inventory**
Full catalogue of all APIs with endpoint paths, methods, environments, owners, and data sensitivity classifications.
 - **Risk Scoring**
Multi-factor risk assessment (data sensitivity, auth weakness, encryption, exposure, age, traffic) with configurable weights.
 - **Zombie & Shadow Detection**
Identifies undocumented APIs, deprecated endpoints still in use, and orphaned services with no clear owner.
 - **Decommission Workflow**
Stage-based pipeline (Detected > Quarantined > Approved > Decommissioned) with auto-decommission dates and PR tracking.
 - **Security Findings**
Per-API vulnerability scanning with severity ratings, CVSS scores, evidence, and remediation steps.
 - **Dashboard & Reports**
Real-time metrics, trends, traffic analysis, risk distribution charts, and exportable reports.
 - **API Detail View**
Deep inspection of any API including traffic metrics, security posture, dependency graph, and audit trail.
 - **Zombie Graveyard**
Kanban-style board tracking all zombie APIs through their decommission lifecycle stages.
 - **Settings & Configuration**
Discovery sources, classification levels, risk scoring weights, notification channels, and integrations.
 - **Integrations**
Connect with Slack, Jira, PagerDuty, GitHub, and custom webhooks for alerts and workflow automation.
